

Reset95 · requires a Mac with Xcode

Bundle ID	com.example.nammasignPhase1 (placeholder)	Min iOS	13.0
-----------	---	---------	------

Already in place

The build-breaking Info.plist corruption is fixed — it is now valid and includes camera, photo-library, photo-add, and microphone usage strings. GoogleService-Info.plist is present, the Firebase iOS app is registered, the deployment target is iOS 13.0, and the entire Flutter/Firebase feature set is shared with Android. What remains is iOS-specific configuration, signing, and store setup.

3 Critical	3 High	6 Store/Cfg
---------------	-----------	----------------

Critical ■ blocks build / submission

#	Item	Why it matters & action
1	Placeholder bundle ID	Still com.example.nammasignPhase1 — Apple rejects com.example.*. Action: set a real reverse-domain ID (e.g. com.nammaempire.reset95), re-register the iOS app in Firebase, replace GoogleService-Info.plist, and update firebase_options.iosBundleId (+ the RunnerTests ID).
2	Apple Developer Program	A paid membership (\$99/yr) is required to sign, run on a device, use TestFlight, or submit. Nothing ships without it, plus a Mac with Xcode.
3	Signing & provisioning	No development team / distribution setup. Action: after #2, set the team, create the distribution certificate and App Store provisioning profile.

High ■ needed for core features

#	Item	Why it matters & action
4	Push / APNs not configured	No entitlements file and no aps-environment. FCM needs the Push Notifications capability + an APNs Auth Key uploaded to Firebase. Phone-OTP on iOS also uses APNs (silent push) — without it, it falls back to a reCAPTCHA web flow. Action: add the capability + APNs key.
5	Sign in with Apple missing	The login screen offers Google + Apple buttons, but Sign in with Apple isn't configured. Apple guideline 4.8 requires it when other social logins are offered. Action: add the capability/entitlement and implement it, or remove the social buttons for launch.
6	App Check (DeviceCheck/App Attest)	iOS equivalent of Play Integrity — not integrated. Action: add the provider and enforce after monitoring.

Store & configuration ■ required to publish

#	Item	Why it matters & action
7	iOS name & strings say NammaSign	CFBundleDisplayName and the camera/photo usage descriptions still read “NammaSign” (the text rename only touched Dart). Action: rebrand them to Reset95.
8	iOS app icon	AppIcon asset set is still the default Flutter icon. Action: add the Reset95 “R” icon to Assets.xcassets/AppIcon.appiconset in all required sizes.
9	App Store Connect + TestFlight	Create the app record, archive with a current Xcode/SDK, and distribute to TestFlight.
10	App Privacy + privacy URL	Complete the App Privacy “nutrition labels” (phone, KYC data, etc.) and provide a public Privacy Policy URL.
11	Deletion + screenshots + compliance	App Store needs an in-app account-deletion path, 6.7”/5.5” screenshots, and an encryption/export-compliance answer.
12	Verify dependency resolution	Confirm pods/SPM resolve and the app archives cleanly on a Mac (the project was kept CocoaPods-light / SPM-friendly).

Recommended sequence

1	Set a real bundle ID and re-register the iOS app in Firebase (new GoogleService-Info.plist + firebase_options).
2	Enrol in the Apple Developer Program; on a Mac, set the signing team + provisioning.
3	Configure APNs (Push capability + APNs key in Firebase); settle Sign in with Apple (add or remove the buttons).
4	Add App Check; rebrand the iOS name/usage strings and app icon to Reset95.
5	App Store Connect: TestFlight build, App Privacy labels, deletion path, screenshots, export compliance.
6	Beta via TestFlight → submit for App Review.

State as of 6 August 2026. “Already in place” = implemented in the codebase; several remaining items require a one-time console/portal action (Firebase, Play Console, Apple Developer) outside the app.
